

Instructions for connecting to OpenVPN on a Mac OS Client (tested on Mac OS 10.15 - Catalina)

1. Download the OVPN file attached from the email received from the UPD VPN administrator.
2. Download and install the Tunnelblick client here:
<https://tunnelblick.net/downloads.html>
Install the **stable** version (you may choose to install the beta version at your own risk).
3. Once installed, make sure Tunnelblick is running (there should be a tunnel-looking icon on your Mac's menu bar). 
4. Double-click the OVPN file you have downloaded. Tunnelblick will ask if you wish to install the configuration for all users. Select **Only Me**.

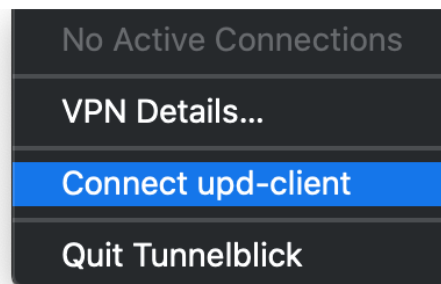

5. Another window will pop up asking for the computer's administrative credentials. Type the password you configured at your computer.

6. A notification will flash on your upper-right screen informing you that the configuration has been installed.

7. Click the tunnel icon at the Menu bar and click “**Connect *profile name***”

8. A floating window will show the connection status, and will inform you once you have connected successfully.
