Project Title: Determinants of the number and rate of graduates from PhD programs in UP Diliman

Project Proponent: T. Monsod

Designation of Proponent: __________

Department and College of Proponent: _______________

Project Abstract:

Project 2 will involve the estimation of a UP Diliman PhD ‘production function’ using multivariate regression analysis of time-series data from UP units with PhD programs. The estimation will identify demand and supply side factors that are important to explaining the number of graduates and/or graduation rates across academic units. It should also provide estimates of the magnitude of effects of these factors so that governance/policy options can be formulated and ranked. Supply side data will be primarily obtained from the OUR through the Office of the Chancellor, although some information may be obtained at the college level. Demand side data will have to be collected with the cooperation of each college with a PhD program.
